OPSCENTRAL | FEATURE PLAN | VERSION 2

Ops Tracker

Bringing the team performance spreadsheets into OpsCentral

Prepared by Harsh Singh | 24 October 2026 | Delivery window: 26 Oct - 13 Nov 2026

Summary

Today the team tracks its work in a Google Sheets workbook: a Task Pipeline sheet that every other tab reads from, plus dashboards for leadership, a daily standup desk, weekly client reports and employee scorecards. It works, but the data is copied by hand, formulas break, anyone can overwrite anything, and there is no history of who changed what.

The plan is to rebuild that workbook as a new **Ops Tracker** module inside **OpsCentral**, our platform. It gets one new item in the left sidebar, with eight screens under it. OpsCentral already has employees, clients, projects, tasks, attendance, logged hours, roles and notifications, so we reuse those and only add what the sheets have that OpsCentral doesn't.

What this delivers

- **One source of truth.** Every task lives in OpsCentral. Dashboards, standups, client reports and the leaderboard are calculated live from it, so nobody re-types data.
- **Open by design.** Everyone can see everyone's tasks and every person's and department's performance on a shared leaderboard.
- **Automatic SLA tracking.** Tasks show live labels like *Due Today* or *Overdue (12d)*, and a completed task can be reopened if more work is needed.
- **Client reports every Saturday.** The Review / Preview / Action report is built automatically on Saturday evening and shared with each client in their client space.
- **Attendance in the same place.** Who is in, working from home or on leave sits next to the work.

Timeline at a glance

Week	Dates	Focus	Demo at end of week
1	26 - 30 Oct	Data foundation, Task Pipeline, two-review flow, Portfolio	Create, review, complete and reopen tasks
2	2 - 6 Nov	Executive Overview, Daily Action Desk, Delivery Canvas	Run a real morning standup from OpsCentral
3	9 - 13 Nov	Leaderboard, Saturday Client RPA, Attendance, sign-off	Leaderboard and a client report; sign-off

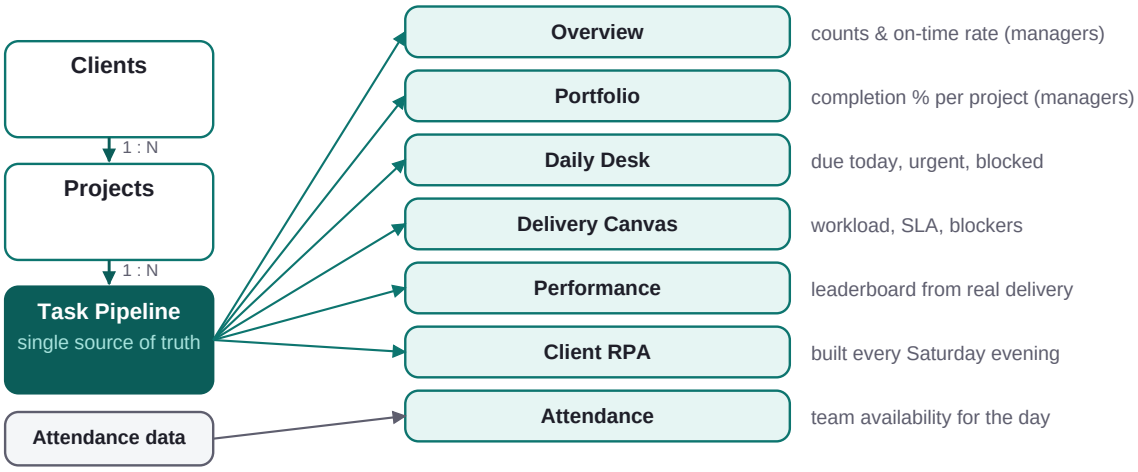
Already done (23-24 Oct): the Ops Tracker sidebar entry, its screens and permission keys are in place, and the product has been rebranded to OpsCentral with its own theme.

What changed in version 2

Topic	Version 2 decision
Product name	Harmony is now **OpsCentral** throughout.
Visibility	Everyone can see everyone's tasks and every person's and department's performance.
Employees	Mostly use the **Task Pipeline** and the **Performance Command Center**, which works as a leaderboard.
Project view	Overview and Portfolio are for **managers only**.
Finance dashboard	For the **CEO only** (Profitability phase).
Client RPA	Generated on **Saturday evening** and shared mostly in each client's **client space**.
Completed tasks	Not frozen. A completed task can be **reopened** and goes back to In Progress.
Reviews	Every task gets **at least two reviews**. Revisions are normal and never lower a score; a first-pass approval is a plus.
My Tasks	New **Reviewer box**: the tasks waiting for my review.
Attendance	A new **Attendance** screen inside the Ops Tracker.

1. From spreadsheet tabs to OpsCentral screens

Clients have projects, projects have tasks, and every report reads from the task list. The Task Pipeline is the only place work is entered; the other screens are views over it. Attendance comes from OpsCentral's existing clock-in and leave data.



Sheet tabs mapped to screens

Sheet today	Ops Tracker screen	Who uses it	What it shows
Dashboard	Overview	Managers, leadership	4 KPI cards (active projects, pipeline tasks, on-time rate, overdue), project health table, at-risk escalation radar
Project Portfolio	Portfolio	Managers	Every project with lead, dates, status, total vs completed tasks and a progress bar
Task Pipeline	Task Pipeline	Everyone	The master task ledger: every task in the company, with filters, inline status changes, reviews and blockers
Daily Action Desk	Daily Desk	Team leads, coordinators	Today's queue (due today or earlier, urgent, blocked) and the SOP checkpoints to tick off
Delivery Dashboard	Delivery Canvas	Everyone	Kanban board with drag-and-drop, workload by person, SLA donut, blockers by cause
Performance Command Center	Performance	Everyone	Leaderboard of every person and department: scores, on-time %, turnaround, first-pass badges, monthly trend

Sheet today	Ops Tracker screen	Who uses it	What it shows
(new)	Attendance	Everyone	Today's team availability (in office, WFH, on leave, late, not clocked in) and monthly attendance per person and department
Weekly Client RPA	Client RPA	Managers, account managers	Review / Preview / Action, built every Saturday evening and shared in the client space

Ops Tracker sits in the sidebar right after **Deliverables** and expands into these eight screens; clicking it again collapses them. A **month filter** at the top (All Months, May 2026, June 2026, ...) drives the numbers on every screen, like the filter cell in the workbook. Employees land on the Task Pipeline; managers land on the Overview.

My Tasks: new Reviewer box

The existing **My Tasks** page gets a **Reviewer box** at the top. It lists every task waiting for my review, with how long it has been waiting and *Approve* / *Return with notes* buttons, so reviews don't get lost. Reviews waiting more than 4 hours are also flagged on the Daily Desk.

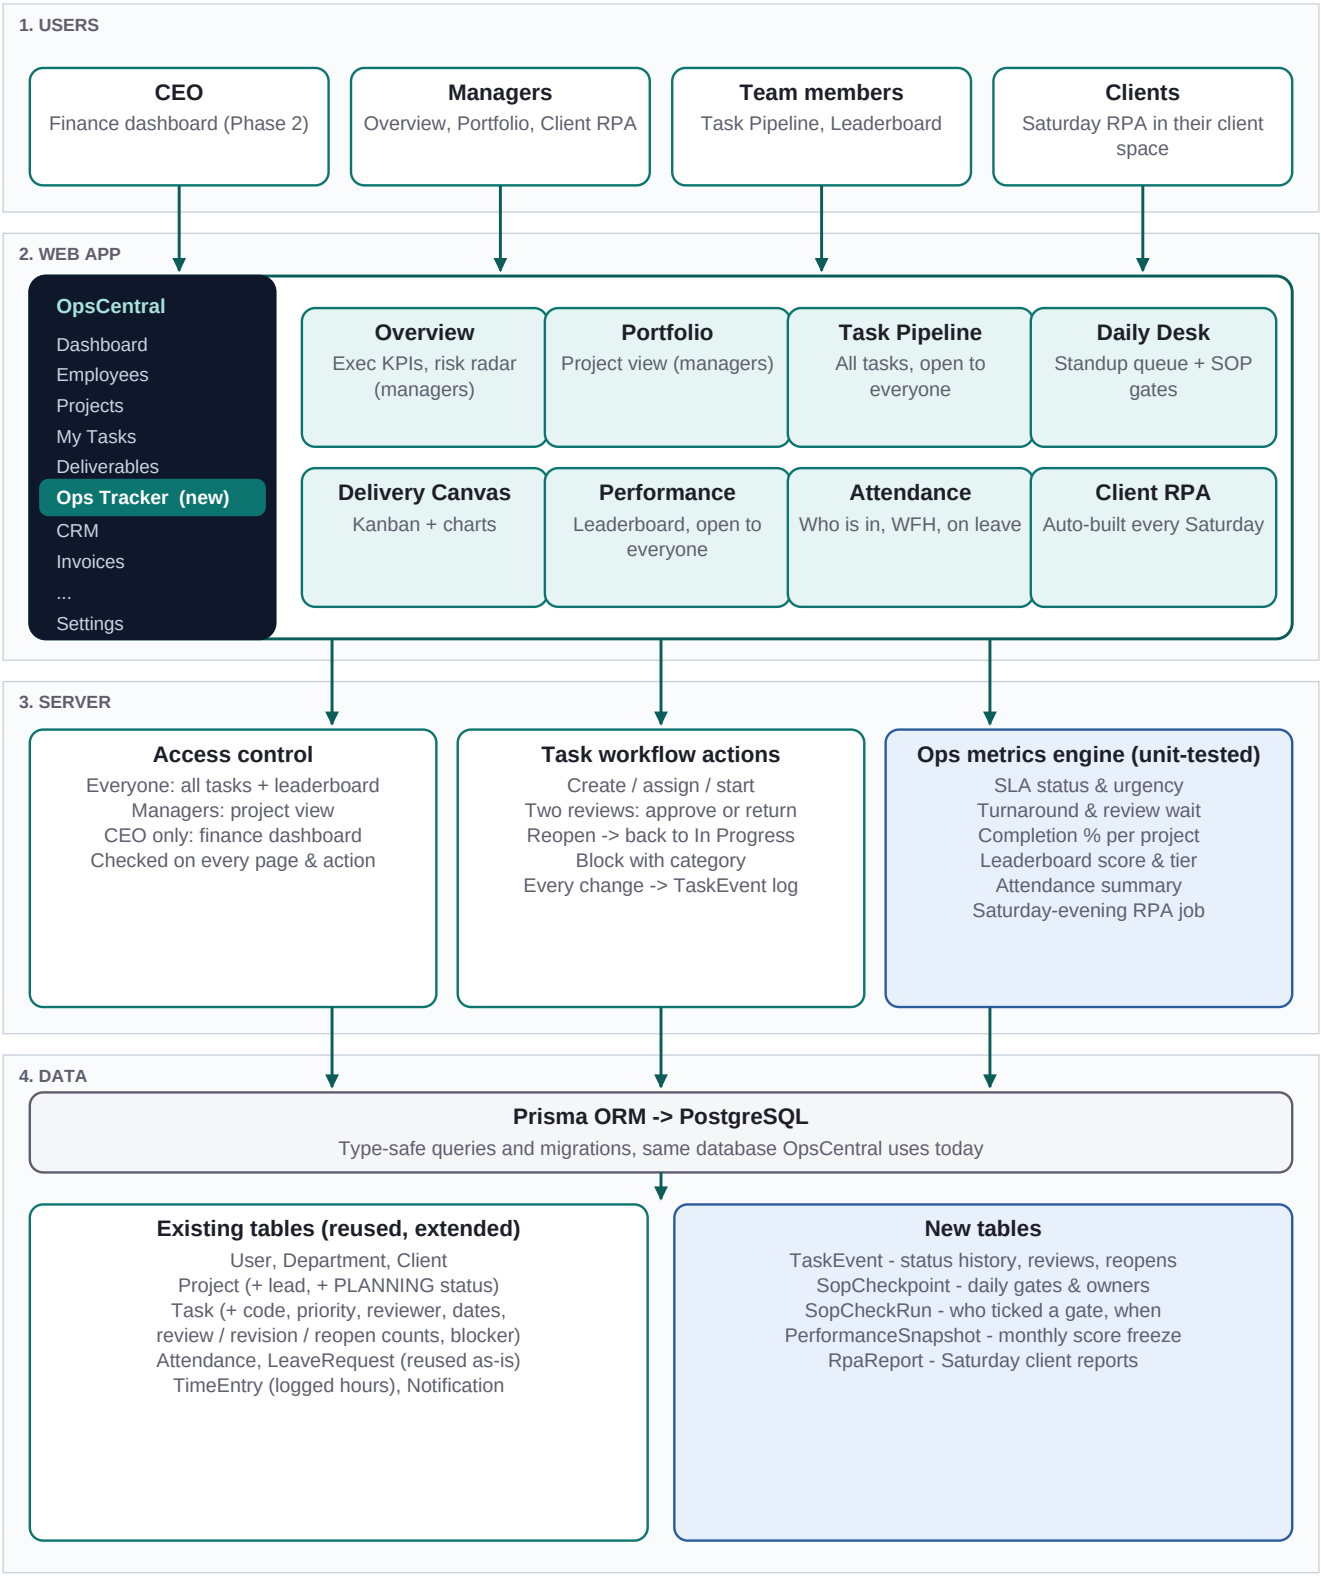
Attendance screen

The new **Attendance** screen brings OpsCentral's existing clock-in and leave data into the Ops Tracker, so the standup and the workload view can see who is actually available:

- **Today:** who is in the office, working from home, on leave, late, or not clocked in yet.
- **This month:** attendance % and late days per person and per department.
- **Next to the work:** people on leave are marked on the Daily Desk and Delivery Canvas, so their tasks can be reassigned before they slip.

2. High-level design

The module is built into the existing OpsCentral app with the same stack: Next.js, server actions, Prisma and PostgreSQL. It needs no new service, server or paid tool. There are four layers, read top to bottom:



How a request flows: a user opens a screen -> the server checks their role -> it loads tasks from the database -> the metrics engine calculates SLA, urgency, scores and so on -> the page renders. When someone changes a task (start, submit for review, approve, return, reopen, block), a server action validates it, saves it, writes a **TaskEvent** history row and sends a notification when needed. Every Saturday evening a scheduled job builds each client's RPA report.

3. Data model: reuse first, add only the gaps

OpsCentral already has users, clients, projects, tasks and attendance, linked to HR, time logging and invoicing. So we **extend the existing tables** rather than build parallel ones. This keeps one task list for the whole company and makes the later Profitability phase much easier.

Changes to existing tables

Table	Add	Why (sheet column it replaces)
Task	code (TSK-001...)	Readable Task ID used in standups and client reports
Task	priority (Urgent / High / Medium / Low)	Queue sorting; Daily Desk shows Urgent items
Task	reviewer(s)	Who does the two reviews; drives the Reviewer box in My Tasks
Task	startDate, underReviewAt	Turnaround time and review wait time
Task	reviewCount, revisionCount	Two-review rule, and revisions for information
Task	reopenCount	How often a completed task was reopened
Task	blockerCategory, blockerNote, clientAction	Escalation radar, blocker chart, RPA Action table
Project	lead, PLANNING status	Project Lead column and the Scoping / Planning phase

New tables

Table	Purpose
TaskEvent	Every status change, review and reopen: who, when, from what to what. It is the audit trail and drives review counts and wait times.
SopCheckpoint	Daily Desk gates, e.g. 09:30 Standup, 13:00 Queue check, 17:30 EOD handover, each with an owner and cadence.
SopCheckRun	A record each time an owner ticks a gate as done for the day, so missed gates are visible.
PerformanceSnapshot	Each person's score for a closed month, frozen so past months on the leaderboard don't change when old tasks are edited.
RpaReport	The report built each Saturday evening for each client, plus the account manager's edits and when it was shared.

Status mapping

Sheet status	OpsCentral status	Notes
Not Started	Pipeline	-
In Progress	In Progress	The existing timer keeps logging hours
Under Review	Pending Approval	Sets underReviewAt; needs two reviews; a reviewer can return it
Completed	Completed	Sets completedDate. Not frozen: it can be reopened
(reopened)	In Progress	Clears completedDate, reopenCount +1, logged in TaskEvent
Blocked	On Hold + blocker category	A blocker category is required when blocking a task

Values the sheet stores but we **calculate** instead: SLA status, urgency label, completion time, review wait, month and project completion %. Calculating them live means they are always right, even after a task is reopened.

4. Business rules (the engine behind every screen)

All rules live in one small code module with automated tests, so every screen uses the same numbers. Items marked **(confirm)** are proposed defaults and can be changed in Settings.

Rule	How it is calculated
SLA status	**On Time** if completed on or before the due date. **Overdue** if completed after it, or if it is still open and today is past the due date. Worked out again each time a task completes.
Reopen	A completed task can be reopened. It goes back to In Progress and its SLA is recalculated at the next completion. Reopens are logged and counted.
Urgency label	Open tasks only: *On Track*, *Due Today*, or *Overdue (Xd)* where X is days past due.
Two reviews	Every task gets at least two reviews before it can be completed.
Revisions	+1 each time a reviewer returns a task. Shown for information only; it never lowers a score.
First pass	Approved at review with no changes requested. Shown as a positive badge on the leaderboard; not having it never counts against anyone.
Turnaround	Completed date minus start date, in hours, with the actual logged timer hours next to it.
Review wait	Time from entering review to the review decision. Shows where reviews are the bottleneck.
Daily queue	Open tasks due today or earlier, **or** Blocked, **or** Urgent, plus reviews waiting more than 4 hours.
Escalation radar	Open tasks overdue by more than 7 days, sorted by age, with blocker and reviewer shown.

Leaderboard score (per person, per month)

Component	Measures	Weight (confirm)
On-time delivery %	Reliability: tasks completed on time / tasks completed	60%
Speed score	(Team-average turnaround / own turnaround) x 100, capped at 100	40%
First-pass badges	Count of tasks approved with no changes	Shown, not scored

Score	Tier (confirm)	Appraisal hint (Management and HR only)
85 - 100	Top Performer	Eligible for bonus
70 - 84	Core Contributor	On track
55 - 69	Needs Support	Coaching suggested
Below 55	Under Review	Flag for HR review (2 months in a row)

Department view: the same score averaged across a department, so departments can be compared too.
3-month trajectory: *Ascending* or *Declining* if the score moved by more than 3 points over the last three closed months, otherwise *Stable*. Fewer than 3 completed tasks in a month shows *Not enough data*.

> **Safeguard.** The leaderboard is open to everyone, so it shows delivery facts only. Appraisal hints (bonus, HR review) are visible only to Management and HR, and the tool never puts anyone on a PIP or approves a bonus by itself. Time blocked by the client is excluded from turnaround.

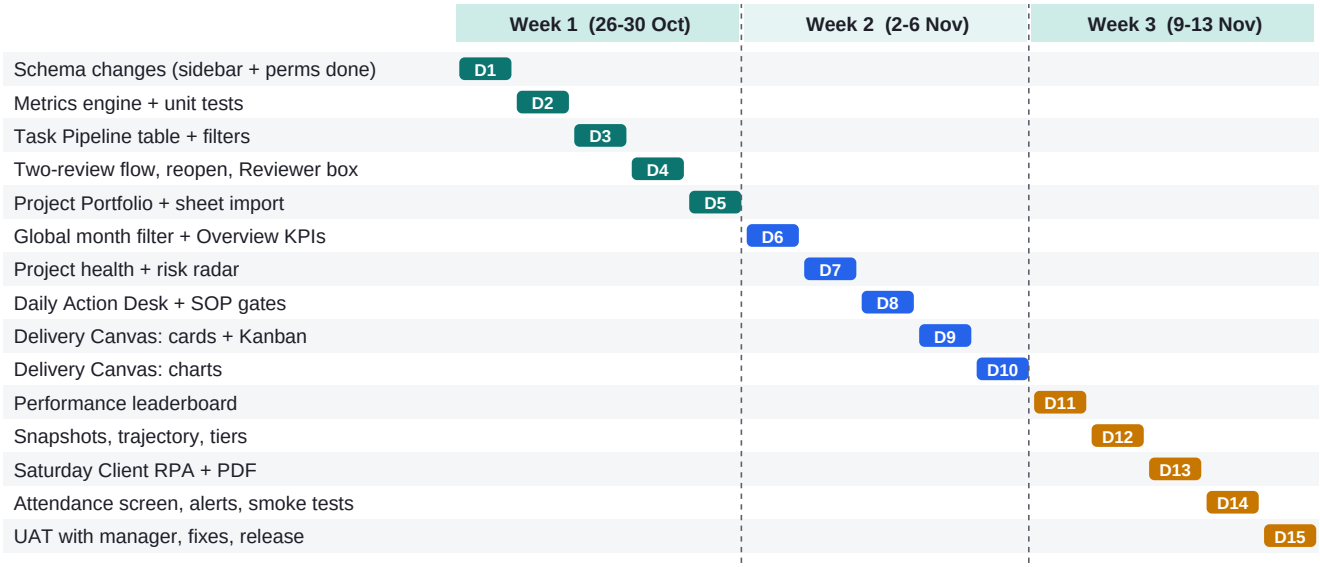
5. Who can see what

Permissions plug into the existing role system (Settings > Access Control), so an admin can still change them per role.

Permission	Grants	Default roles
ops.view	Task Pipeline (all tasks), Performance leaderboard (everyone), Daily Desk, Delivery Canvas, Attendance	Everyone
ops.manage	Project view: Overview and Portfolio; managing SOP checkpoints	Management, Operations, Manager
ops.rpa	Review and edit the Saturday client RPA before it is shared	Management, Operations, Manager
ops.performance	Appraisal hints on the leaderboard (bonus / HR review)	Management, HR
finance.dashboard	Finance and profitability dashboard (Profitability phase)	CEO only

6. Three-week delivery timeline

15 working days, Monday 26 October to Friday 13 November 2026. Each week ends with a demo on real data. The first live Saturday RPA run is Saturday 14 November.



Phase 2 (after these 3 weeks): the CEO-only Finance / Profitability dashboard (revenue, labour cost from logged hours, expenses and margin per project and client) and a Gantt timeline view.

Day-by-day plan

Day	Work	Done when
Week 1 - Foundation & Task Pipeline		
D1 Mon 26 Oct	Database changes and migration (sidebar and permissions already done)	Migration runs clean
D2 Tue 27 Oct	Metrics engine: SLA, urgency, turnaround, review wait, completion %	Unit tests pass
D3 Wed 28 Oct	Task Pipeline: every task, filters, inline status	Filter by month and person
D4 Thu 29 Oct	Two-review flow, return, reopen; Reviewer box in My Tasks; event log	Review and reopen loop works
D5 Fri 30 Oct	Portfolio (managers only); one-time import of the Google Sheets data (CSV)	**Demo 1**
Week 2 - Daily operations views		
D6 Mon 2 Nov	Global month filter; Overview KPI cards	Numbers match the sheet
D7 Tue 3 Nov	Project health table; at-risk escalation radar	Radar lists > 7-day overdue
D8 Wed 4 Nov	Daily Desk: priority queue, pending reviews, SOP checkpoints	Standup can run from it
D9 Thu 5 Nov	Delivery Canvas: KPI cards and Kanban drag-and-drop	Drag changes status
D10 Fri 6 Nov	Delivery Canvas charts: workload, SLA donut, blockers	**Demo 2**
Week 3 - Leaderboard, client reporting, attendance, sign-off		
D11 Mon 9 Nov	Performance leaderboard for everyone: people and departments	Scores match a hand check
D12 Tue 10 Nov	Monthly snapshots, 3-month trajectory, tiers, first-pass badges	Past months stay fixed
D13 Wed 11 Nov	Client RPA: Saturday-evening job, edit, share to client space, PDF	Test run succeeds
D14 Thu 12 Nov	Attendance screen; overdue / blocked / review alerts; role checks	All checks green
D15 Fri 13 Nov	UAT with manager, fixes, short user guide, release	**Demo 3 + sign-off**

7. Quality, risks and decisions needed

- **Automated tests** for every rule on page 6 (SLA, reopen, urgency, scores, tiers), run on every change.
- **Parallel run** in Week 3: the sheet and OpsCentral side by side, with every KPI compared before switching over.
- **Audit trail:** every status change, review and reopen is logged, so any number can be traced to its tasks.

Risk	Mitigation
Messy sheet data (names spelled differently, missing dates)	Import reports every unmatched row; fixed together on D5
Open leaderboard compares people doing different work	Filter by role and department; score uses on-time and speed, not volume
Two reviews per task slow delivery down	Reviewer box, review-wait tracking and Daily Desk flags after 4 hours
Diwali week (around 8 Nov) reduces availability	D14-D15 are buffer; Attendance can slip to the following week
People keep updating the sheet after launch	Sheet goes read-only after sign-off

#	Decision needed	My proposal
1	Score weights: on-time / speed	60 / 40, first-pass shown as a badge
2	Tier score bands	85 / 70 / 55
3	Who does the two reviews on each task	Team lead first, then the project manager
4	Saturday RPA: post automatically, or after the account manager approves	Built at 5 PM, posted after approval
5	Which client space gets the RPA	The client's shared channel, with the PDF attached
6	Months of history to import from the sheet	May 2026 onwards
